

## Setup

1. Generate a new Spring Boot application from Spring Initializr
2. Unzip the Spring Boot project
3. Unzip the given JavaScript application into the applications `src/main/resources/static` directory
4. Start the Spring Boot application and open localhost:8080

## Task

The application is an online calculator. It will make a request to the Spring Boot application to perform the given calculation.

Write a controller to perform the calculation. The controller should return the result in the following JSON object

```
{
  "result": <the result of the operation>,
  "timestamp": <time and date on the server>,
  "userAgent": <User-Agent HTTP header that made
the request>
}
```

The data type of the JSON attributes are

- **result** - number
- **timestamp** - string
- **userAgent** - string

If response conforms to the above specification, you will see a

otherwise
